The present sequence represents a floral homeotic protein, designated PTAG-1, which is derived from Populus balsamifera subsp. trichccarpa. The specification also describes PTD, PTLF, and PTAG-2 proteins. The floral homeotic proteins are expressed in floral tissues. PTLF is a homologue of LEAFY (LFY) and FLORICAULA (FLO), and is expressed in

designated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immature inflorescences on which floral primordia are developing. PTD is a homologue of DEFICIENS (DEF), and is strongly expressed in stamer primordia from the onset of organogenesis. PTAG-1 and PTAG-2 are homologues of AGAMOUS (AG). The floral homeotic proteins and polynucleotides are useful for producing transgenic plants having
      New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide
                                                                                                                                                                                                                        09-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-helix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain cipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2

AGE-2 shows 62% homology to AG and 64% homology to PLE protein. AGE2 is very highly expressed in anthers and flower buds. A related protein, AGE-1 (AAR99633), was also identified. Antisense or ribozyme constructs of AGE, or of FLE2 and SQE genes (see also AAT34426 and AAT34429-31), can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AGE-2 protein (AAR99637) is the product of a cDNA clone, AGE2 (AAT34432), isolated from Eucalyptus globulus cDNA on the basis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the PrMADS3 protein of Pinus radiata, deduced from an isolated cDNA clone (see AAV18012). Expression of PrMADS3 is restricted to male and female cones. The PrMADS1, 2 and 3 proteins (see also AAW48622 and AAW48623) have been expressed in E. coli and characterised as DNA binding proteins. Their DNA binding consensus sequence is similar to that of the ACAMOUS protein. All 3 proteins bind a Squence matching the consensus sequence of the CArG box. The invention relates to genes from reproductive tissues of Pinus radiata and Eucalyptus grandis and the use of the promoters (see AAV18013, AAV18015, AAV18017 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV18019-22) of such genes in expression cassettes used to modify a plant, especially a tree used in timber, pulp or fibre production, to increase vegetative growth and thus production of valuable material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method of enhancing vegetative growth in plant - comprises use of expression cassette containing heterologous coding region expressing product which aborts development

The promoter is located in plant reproductive tissue, and the invention includes transgenic plants containing the promoter. The promoter can be used to produce plants which have a diminished reproductive capacity or which are sterile. The constructs can also be used to transform agronomically

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors and host cells comprising the zmmADS2 regulatory or genomic sequence, and their use in the generation of transgenic plants. The ZmmADS2 regulatory sequences are useful for cloning and expressing a pollen-specific or pollen abundant gene in a plant, and may also be used to drive the expression of a gene of interest in a pollen-specific or pollen-preferred manner. The ZmmADS2 regulatory sequences are useful for isolating related regulatory sequences of other plant species which confer pollen or group specificity to genes of interest operably linked to them. The regulatory sequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the pollen-specific expression of heterologous genes which confer nuclear or cytoplasmic male enteritity in transgenic plants (e.g., cereals). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to regulatory elements (AAF76059-AAF76067) the maize MADS box gene ZmMADS2 (AAF76068) which are capable of expression in a pollen-specific manner. The ZmMADS2 protein (AABF) is expressed particularly in mature pollen after dehiscence, indicate the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1268 BP; 360 A; 298 C; 303
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             represents cDNA encoding ZmMADS2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                970
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      773
```

Novel nucleic acid mole useful for cloning and and for producing male

molecule,

ZmMADS2 derived from

specific seque

sequence

of Zea ence in

mays a plant

a pollen

sterile plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of the Zea mays ZmMADS2 protein, which is specifically expressed in pollen. The sequences can be used to produce male sterile plants, as ZmMADS2 is essential for pollen tube growth. These are useful in hybrid breeding, particularly of corn, cereal and grain. The present sequence is the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Вb
The invention relates to regulatory elements (AAF76059-AAF76067) from the maize MADS box gene ZmMADS2 (AAF76068) which are capable of directing expression in a pollen specific manner. The ZmMADS2 protein (AAB7333) is expressed particularly in mature pollen after dehiscence, indicating that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors and host cells comprising the ZmMADS2 regulatory or genomic sequence, and their use in the generation of transgenic plants. The ZmMADS2 regulatory sequences are useful for cloning and expressing a pollen-specific or pollen-abundant gene of interest in a pollen-specific or pollen-preferred manner. The ZmMADS2 regulatory sequences are useful for isolating related regulatory sequences of other plant species which confer pollen or group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1134

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specificity to genes of interest operably linked to them. The regulatory sequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the pollen-specific expression of heterologous genes which confer nuclear or cytoplasmic male sterility in transgenic plants (e.g., cereals). The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of zea mays ZmMADS2 protein, which is specifically expressed in poll sequences can be used to produce male sterile plants, as ZmMADS2 essential for pollen tube growth. These are useful in hybrid bree particularly of corn, cereal and grain. The present sequence is p the ZmMADS2 coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecule, ZmMADS2 derived from pollen of Zea mays useful for cloning and expressing a pollen specific sequence in a plant of producing male sterile plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 5031 BP; 1555 A; 1006 C;

sequences are useful for cloning and expressing a pollen-specific or pollen-abundant gene in a plant, and may also be used to drive the expression of a gene of interest in a pollen-specific or pollen preferred manner. The ZmMADS2 regulatory sequences are useful for isolating related regulatory sequences of other plant species which confer pollen or group specificity to genes of interest operably linked to them. The regulatory sequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the pollen-specific expression of heterologous genes which confer nuclear or cytoplasmic male sterility in transgenic plants (e.g., cereals). The present sequence represents the ZmMADS2 gene 5' untranslated region (5' UTR).
                                                                                                                                                                                                                                                                                             The invention relates to regulatory elements (AAF76059-AAF76067) from the maize MADS box gene ZmMADS2 (AAF76068) which are capable of directing expression in a pollen-specific manner. The ZmMADS2 protein (AAR73333) is expressed particularly in mature pollen after dehiscence, indicating that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors and host cells comprising the ZmMADS2 regulatory or genomic sequence, and their use in the generation of transgenic plants. The ZmMADS2 regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specific

The sequences can be used to produce male sterile plants, as ZmMADS2 is essential for pollen tube growth. These are useful in hybrid breeding, particularly of corn, cereal and grain. The present sequence is part of the ZmMADS2 coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acid molecule, 2mMADS2 derived from pollen of Zea mays useful for cloning and expressing a pollen specific sequence in a plant and for producing male sterile plants \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-helix zipper, LIM domain, AP2 and EREBs, zinc finger domains of type 2 Cys2His2, CCAAT box elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 706
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim

                                                                                                                                                                                                                                                          globulus cDNA using primers based on homologous regions of the Arabidopsis and Antirrhinum genes, followed by a screening of a E. globulus library. It codes for a protein, AGE-2 (AAR99637), that shows homology to the AG and PLE proteins. AGE2 is strongly expressed in anthers and flower buds. Another cDNA clone, AGE1 (AAR34428), was also identified. Antisense or ribozyme constructs of AGE, or of FLE2 and SQE genes (see also AAR34426 and AAR34429-31), can be used to produce sterile transgenic Eucalyptus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eucalyptus; reproductive gene; AGE2; Arabidopsis; agomous gene; Antirrhinum; plena gene; sterility; fertility; forest tree; transgenic plant; flower development; antisense; ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                               A cDNA clone (AAT34432), designated AGE2, is analogous to t Arabidopsis agamous (AG) and Antirrhinum plena (PLE) flower development genes. It was obtd. by PCR amplification of E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eucalyptus reproductive Eucalyptus trees useful

The invention relates to regulatory elements (AAF76059-AAF76067) from the maize MADS box gene ZmMADS2 (AAF76068) which are capable of directing expression in a pollen-specific manner. The ZmMADS2 protein (AAB7333) is expressed particularly in mature pollen after dehiscence, indicating that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors and host cells comprising the ZmMADS2 regulatory or genomic sequence, and their use in the generation of transgenic plants. The ZmMADS2 regulatory pollen-specific or pollen-abundant gene in a plant, and may also be used to drive the

ZmMADS2

coding sequence.

The present invention provides the protein and coding sequences of the Zea mays ZmMADS2 protein, which is specifically expressed in pollen. The sequences can be used to produce male sterile plants, as ZmMADS2 is essential for pollen tube growth. These are useful in hybrid breeding, particularly of corn, cereal and grain. The present sequence is part of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expression of a gene of interest in a pollen-specific or pollen-preferred manner. The ZmMANS2 regulatory sequences are useful for isolating related regulatory sequences of other plant species which confer pollen or group specificity to genes of interest operably linked to them. The regulatory sequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the pollen-specific expression of heterologous genes which confer nuclear or cytoplasmic male sterility in transgenic plants (e.g., cereals). The present sequence represents a ZmMADS2 gene 3' regulatory element.

                                                                                                                       This invention relates to a novel plant promoter gene. The promoter is located in plant reproductive tissue, and the invention includes transgenic plants containing the promoter. The promoter can be used to produce plants which have a diminished reproductive capacity or which are sterile. The constructs can also be used to transform agronomically important plants in which modulation of reproductive capacity (particularly the timing and abundance of flowering) is desirable, e.g. cereals, rice, maize, wheat, barley, oats, rye, soybean and canola. The present sequence represents DNA encoding the plant reproductive promoter (PrAGI) of the invention.
